

Interested in a *natural resources* job, then Northwest Campus's **High Latitude Range Management** certificate program might be for you!

This program brings together local experts and university faculty to offer courses that are relevant to residents of our region and help prepare students for entry-level jobs in the field of natural resources. Students will learn field-based techniques that agencies use to inventory and monitor plant and animal populations. They will also be trained in the ecological concepts of sustained yield and the management of animal populations in the north.

If you have a high school diploma or GED, as well as an interest in science-related work, this program might be for you! For more information:
